What We Do for Realtors & Lawyers

Thanks for taking the time to visit our site to learn more about MMI. It's been a pleasure associating and working with many of you; some all the way back to my start with Chester County Health Department, in 1978. We trust that this Committee shall continue to be the forum in which those of us serving within our Commonwealth, network with allied disciplines. In my opinion, our Bar Association hosts the "cream" of those truly "hands-on" within real estate transactions. For no other reason, we prefer to serve fellow DVRA members.

Many of you (some even at prior engagements) approached us for additional information, on the sweeping changes to on-site sewerage disposal, as it relates to land-planning. It is difficult to do in a half-hour lunch meeting or even a follow-up mailing such as this. Because I treasure the opportunity to educate others concerning these matters (can you tell?), MicroLife does not bill for our time during the conceptual phase of projects. Even if you just want to discuss new options available to those integrating wastewater disposal, into land-planning/development, please call and schedule a free consultation. We don't shy away from site work and actually prefer to meet you in the field. As true independents, who have no direct affiliation with firms installing systems, selling equipment or other such "biases", we bring all options to the table! Let us help you think outside the box. Hopefully, we've now got you pondering waste without water ???

Over the years, it has become obvious that we "sewer-rats" share much in common with a wide variety of stakeholders in stewardship of Pennsylvania's water quality. **MicroLife Management now devotes much of its consulting service to those working in public sewerage facilities. But, as we endeavor to educate those contributing flow to publicly owned treatment works (POTW), many principles of water quality management remain the same, as those essential for on-site sewerage disposal....especially, "think before you flush" !! Now it seems, that many of the very same measures advanced to enhance water quality, are coming into question....does conservation exhibit a "diminishing return" ?? Of course, all parties wish to limit the flow to either on-site or POTW facilities. But, have we somehow inadvertently concentrate wastes, in the process? This is why it's vital that we inspect facilities (especially septic systems via PSMA), first hand.**

These and many other challenges face those charged with the design, construction, maintenance and regulation of wastewater, regardless of where it is disposed (including incineration and solid waste "cross-media pollution" issues). It is increasingly obvious that environmental regulation now dominates all aspects of real estate business: From residences intimately associated with on-site wastewater management, to commercial/industrial/brownfield property, faced with understanding past land uses or living in harmony with POTW. You've much to tackle alone. Realtor and lawyers both need **MicroLife. Thanks for your time....hoping to hear from you soon,**
